No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 2, Ay

Patent No. 5525496
GENERAL INFORMATION:
APPLICANT: MARGAREH H. Lai
APPLICANT: MARGAREH H. Lai
TITLE OF INVENTION: A DNA Sequence Encoding Sterol
Patent No. 5525496
TITLE OF INVENTION: 14
TITLE OF INVENTION: Reductase
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Match 39.8%; Score 300.5; DB 1; Local Similarity 48.7%; Pred. No. 5.7e-28; les 55; Conservative 18; Mismatches 37;

ALIGNMENTS

The present sequence is that of a soybean sterol delta-14 reductase polypeptide, as deduced from a partial coding sequence from the full insert sequence of a clone (see AAF30676) isolated from a cyst nematode-infected soybean 8-day-old theory in the predicted polypeptide shows amino acid sequence homology to Arabidopsis thaliana and Ascobolus immersus sterol delta-14 reductases. The invention relates to sterol delta-14 reductases. It also relates to transgenic plants comprising the polymucleotides. It also relates to the construction of a chimeric gene encoding all or a portion of the sterol delta-14 reductase, in sense or antisense orientation, where expression of the chimeric gene results in production of altered levels of the catantiformed host cell. The availability of plant sterol delta-14 reductase genes will provide a means of altering sterol production Novel gene encoding sterol delta-14 reductase useful for transgenic plant production with altered sterol delta-14 reductase. Soybean, sterol delta-14 reductase; transgenic plant; herbicide; fungicide. Soybean sterol delta-14 reductase polypeptide. & COEI. Claim 1(b); Page 38; 45pp; English. The present sequence is that of soybean sterol delta-14 reductase, as deduced from a full-length coding sequence from the full insert sequence of a clone (see AAF30677) isolated from a soybean shoot meristem cDNA library. The predicted protein shows amino acid sequence homology to Arabidopsis thaliana and Ascobolus immereus sterol delta-14 reductases. The invention relates to sterol delta-14 reductase polynucleotides and polypeptides and to transgenic plants comprising the polynucleotides and polypeptides and to transgenic plants comprising the polynucleotides and polypeptides and to transgenic plants comprising the polynucleotides and polypeptides and the construction of a chimeric gene results in production of the sterol delta-14 reductase, in sense or antisense orientation, where expression of the chimeric gene results in production of a valiability of plant sterol delta-14 reductase genes will provide a means of altering sterol production and/or composition of plants, to identify compounds that may be useful as novel herbicides and fungicides, and to identify mutants of these genes that are resistant to these therbicides and will enable the production of herbicide-resistant crops
                                                                                                                                     ö

                                                                                                                                                                                                           290
                                                                                                                                                                                                                                    This polypeptide comprises a novel C-14 sterol reductase (C14SR), ELL, of Arabidopsis thaliana. Its amino acid sequence was deduced from an isolated CDNA clone (see AAVC4237) and shows 35% identitity to C14SR (Erg34) in yeast and 40% identity to the lamin B receptor in humans. A pure plant C14SR is claimed, as are purified DNA encoding C14SR, a vector, a method of producing recombinant C14SR using transformed plant cells, a transgenic plant that expresses C14SR DNA and a seed or cell from such a plant, and methods for detecting and isolating a C14SR gene, and for reducing the level of C14SR in a transgenic plant using an antisense construct. The genetic manipulation of plant sterol composition is useful for improving food quality and oil stability, and for regulating the formation of compounds having anti-nutritional properties.
                                                                                                                                                                               65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated plant C-14 sterol reductase gene - used to develop products for the genetic manipulation of a plant sterol biosynthetic pathway to improve plant characteristics.

Reduced production of C14SR can increase the life-span of plants and produce plants having reduced and more compact proportions.

Overproduction is useful for enhancing the production of medically or agriculturally useful steroid compounds. C14SR polypeptides are also useful for the development of enzyme inhibitors of the steroi
                                                                                                                                                                   Gaps

The method comprises determining the expression of a set of human genes or expression products in an endometrial sample suspected of being cancerous. The human genes of the invention are differentially expressed in breast tumours characterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products.
                                                                                                                                                                                                                                    235 NKVELTVPAIVVNCLVFLIGYMVFRGANKQKHIFKKNPKTPIMGKPPVVVGGKLLVSGYM 294

The present invention relates to 26 secreted human proteins. The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperpioliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any involving abnormal angiogenesis, neurodegeneration

The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any involving abnormal angiogenesis, neurodegeneration

This invention describes a human Delta7-sterol reductase. The encoding DNA can be used to diagnose or correct human Delta7-sterol reductase gene defects e.g. hereditary Smith-Lemil-Opitz syndrome, and to produce the recombinant Delta7-sterol reductase polypeptide, which can be used to replace a defective Delta7-sterol reductase enzyme in humans or other animals. It is also useful to screen for Delta7-sterol reductase inhibitors or to introduce and remove double bonds in synthetic and naturally occurring organic polymeric ring systems (Delta 7-sterol reductase catalyses the conversion of 7-dehydrocholesterol to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a human secreted protein. Human secreted protein polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include mutritional activity, cytokine and call proliferation/differentiation activity, hammes stimulating (e.g. as vaccines) or suppressing activity, hammestopoises regulating activity, tissue growth activity, activity, chemotactic/chemokinetic activity, receptor/ligand activity, and hammatory activity, cadherin/tumour invasion suppressor activity, and tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description
                                                                                                                                                                                                                                                                                                                                                                                    US-10-069-427-6

The present sequence is that of the full insert sequence of clone sr23c.pk009.c1, which includes a partial coding region for soybean sterol clata-14 reductase (see AAB2030). The clone was isolated from a cDNA library prepared from soybean 8-day-old root infected with cyst mematode, following database homology searches. The predicted polypeptide shows manerus sterol delta-14 reductases. The predicted polypeptide shows immersus sterol delta-14 reductases. The invention relates to isolated polynucleotides encoding sterol delta-14 reductases and to transgenic plants comprising such polynucleotides. It also relates to the construction of a chimeric gene encoding all or a portion of the sterol delta-14 reductase, in sense or antisense orientation, where expression of the chimeric gene results in production of altered levels of the enzyme in a transformed host cell. The availability of plant sterol delta and reductase genes will provide a means of altering sterol production and movel herbicides and fungicides, and to identify compounds that may be useful as novel herbicides and these herbicides and will enable the production of that are resistant to these herbicides and will enable the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ArgGluIleTrpAlaGluTyrCysLysLeuValProTrpArgIleLeuProTyrValTyr 140

This invention relates to the identification and isolation of novel nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/ or leaf surface features in plants, such as chlorotic, bleaching, etching, wet leaf, stunting, elongation and texture phenotypes, which are thought phenotypes can affect growth regulation i.e. useful for creating dwarf phenotypes can affect growth regulation i.e. useful for creating dwarf ovarieties, exhibit resistance to insects or heat stress, confer changes in pigment content such that plants have enhanced vitamin production or delayed senescence and also for example produce plants that control the production of ethylene. Furthermore, the present invention comprises generating transgenic plants, as well as reproducibly altering the visual phenotype of plant seeds, plant tissues and plant cells containing the plants confers an alteriar phenotype when expressed in DNA sequence that confers an altered visual phenotype when expressed in plants, the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    328
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CCCATATGGGGTAAGCCTCCAAAAGTTATTGGGGGGAAGTTGCTGGCTCTGGGTATTGG 388

                                                                   ds; visual phenotype; plant; architecture; leaf surface; chlorotic; bleaching; etching; wet leaf; stunting; elongation; texture; agronomic trait; growth regulation; dwarf variety; insect resistance;
                                 DNA (SeqID 1069) that confers an altered visual phenotype in plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated nucleic acid derived from Nicotiana benthamiana, C
sativa, Saccharomyces cerevisiae, and Papaver rhoeas, useful for
conferring altered visual phenotypes in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 625 BP; 165 A; 117 C; 149 G; 194 T; 0 U; 0 Other;

The clone was isolated from a cDNA library prepared from corn by whorl section + ECB1, following database homology searches. The predicted polypeptide shows amino acid sequence homology to Arabidopsis thaliams and Ascobolus immersus sterol delta-14 reductases. The invention relates to isolated polymenties encoding sterol delta-14 reductases and to transgenic plants comprising such polymucleotides. It also relates to transgenic plants comprising such polymucleotides. It also relates to the construction of a chimeric gene encoding all or a portion of the sterol delta-14 reductases will provide a means of altered levels of the enzyme in a transformed host cell. The availability of plant control delta-14 reductase genes will provide a means of altering sterol production and/or composition of plants, to identify compounds that may these genes that are resistant to these herbicides and will enable the production of herbicide-resistant crops
